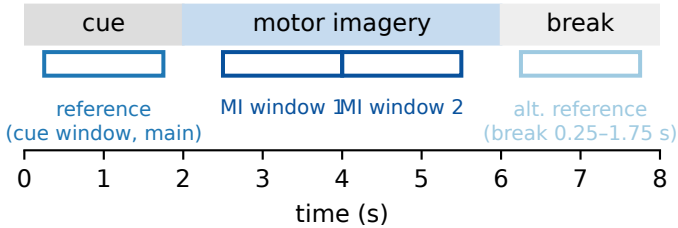
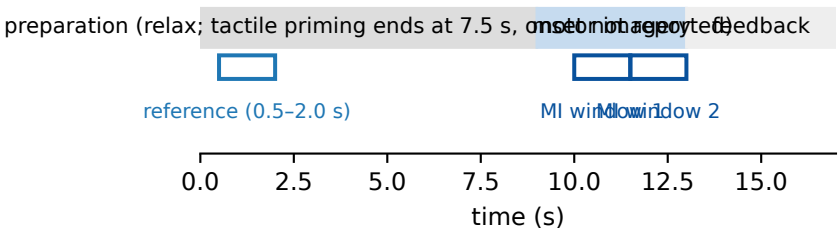
A Acute dataset (Liu 2024): one 8-s trial



B Chronic dataset (HS Stroke): one 17-s trial



C Chronic deployment analysis: what is fitted where

Session 1	rule formula fixed; reference = median rest power; threshold: Youden (labelled) or 80th pct of rest scores (label-free); LDA trained
Session s ≥ 2, fixed	reference & threshold from session 1 → balanced accuracy on all trials
Session s ≥ 2, prospective k	reference = rest windows of first k trials (k = 5/10/20); evaluate on trials k+1…end; threshold unchanged
Session s ≥ 2, offline	reference = all rest windows of the session (uses future data; upper reference)
